

User Manual

[MD-400D 3D Printer]

*Please read this guide carefully before using this printer

Shenzhen MINGDA Technology Co.,Ltd

V2.0

Thank you for choosing MINGDA Technology's products!

For the best experience, please read this user manual carefully and follow the instructions to operate the printer. If you encounter any issues with the printer, please contact us using the contact information provided at the end of this user manual. Our team is always ready to provide you with high-quality service.

To enhance your usage of our product, you can also learn how to use the printer through the following means:

1. User Manual: Relevant instructions and videos can be found on the included USB drive.
2. You can also visit our official website (www.3dmingda.com) for information on software, hardware, contact details, device instructions, device specifications, and warranty information, among other things.

Cautionary Notes

1. Please do not place the printer in environments with significant vibrations or instability, as machine shaking can affect the print quality.
2. Avoid touching the nozzle and heated bed while the printer is in operation to prevent potential burns from high temperatures, resulting in personal injury.
3. Refrain from moving the device during the printing process to prevent accidents and injuries.
4. Do not dismantle the equipment or alter circuit settings without authorization.
5. Avoid using the device in high-temperature or humid environments to prevent compromising device performance or creating safety hazards.
6. In case of an emergency, immediately cease using the device and power it off.

1. Overview

This manual provides instructions on the usage of the 3D printer, covering aspects such as an overall introduction to the device, operational procedures, maintenance, and care. The aim of this manual is to assist you in correctly using and maintaining the 3D printer, ensuring device performance and safety, extending the lifespan of the equipment, and enhancing print quality. We hope that you follow the requirements and recommendations outlined in this manual during usage, and maintain attention to and care for the equipment. Thank you for choosing our product, and we wish you a pleasant experience!

2. Device Introduction

Device Parameters

Basic Parameters	
Product Model	MD-400D
Machine Dimensions	690*790*910mm
Max. Build Dimensions	400*400*400mm
Duplicate Mode	400(2*200)*400*400 mm
Mirror Mode	320(2*160)*400*400 mm
Print Technology	Fused Deposition Modeling (FDM)
Rated Voltage	100-240V, 50/60Hz
Rated Power	800W
Ambient temperature	10°C-30°C / 50°F-86°F
Extruders	Two
Max. Nozzle Temperature	350°C
Max. Bed Temperature	110°C
Screen	7inch touch screen
Printing Method	USB Flash Disk / LAN Printing
Connection	USB Flash Disk / WIFI / Ethernet
Power Loss Recovery	Yes
Filament Detection	Yes
Fast Auto leveling	Yes
Camera	Yes
Fast Calibrate Offset	Yes
Supported Filament	Common filament: PLA, TPU, PETG; Engineering filament: PET-CF/GF, HtPA-CF/GF, ABS-GF25/CF20, HtPA-GF25/CF25; Support filament: S-Mulit, S-HtPA, PVA, etc

Packing List

Tool List

U-disk

Allen wrench

Power cable

Warning lights

Antenna

Note: The 400D is equipped with a hardened steel nozzle. If you frequently print high-temperature materials, long-term printing will cause wear to the nozzle. We recommend replacing the nozzle every 500 printing hours.

Machine Components Overview

3. Operational Steps

Parts assembly

1. Install the indicator light

Green light: Indicates that the printer is working properly.

Red light: Indicates that the printer is in an emergency stop or fault state, requiring immediate attention or repair by the user. For example, overload, short circuit, or error message on the screen.

Yellow light: Indicates that the printer is in a warning or abnormal state, requiring user attention or intervention. For example, insufficient filament or paused printing.

2. Install the Antenna

3. Power on

Insert a power socket, Press the switch

Press the power to turn on the printer

Please make sure the voltage is correct before plugging in.

4. Power off

When you turn off the printer, please don't press the power directly!
Click "Shutdown"  to turn off the printer

Click the "Shutdown" 

Startup Configuration

1. Select Language

Click  to choose the language, and click  to proceed to the next step.

2. Wi-Fi

Note: If printer can't detect your WiFi, you can click  to skip this step. After finishing the startup wizard, move the printer to a position which have stronger WiFi signal, connect it again.

Select the WiFi and click 
(If your WiFi cannot be displayed for more than 20s, please click  to refresh)

Enter the WiFi password and click 

Once the connection is successful, click 

Upon successful connection, click the  in the upper right corner to enter the main interface of the machine. If you do not need to connect to the network, you can also click the  to skip this step.

Printer Calibration

Shenzhen MINGDA Technology Co.,LTD
www.3dmingda.com

Tip: Please follow the sequence shown in the diagram to calibrate step by step.

Z Calibrate → Leveling → XY Offset → Z Height Diff → Input Shaper → Calibrate PID

1. Z Calibrate

Click "Z Calibrate"

Click "Start" , the XYZ axes will move automatically

Put an A4 paper between the nozzle and heated bed.

While moving the A4 paper back and forth, adjust and . When you feel slight resistance as the paper moves, you can click the to save.

2. Auto Bed Leveling

Click "Leveling"

Click to start auto-leveling, which will take approximately 3 minutes

Click to save the value, the printer will reboot automatically.

3. XY Offset Calibration

The camera was covered with the PEI, remove the PEI at first.

Pull the PEI sheet out until the camera and probe are exposed. then hang the PEI on the metal bracket.

Click "XY Offset"

After the camera Led light up, Click "Start", and the left extruder will move to the calibration camera's position.

Adjust the left extruder nozzle to align with the crosshairs of the screen and click "Confirm Pos". Then the right nozzle will move upon the camera automatically.

Adjust the right extruder nozzle to align with the crosshairs of the screen click "Confirm Pos" and click "Save". And the printer will reboot.

Tips: Wipe the nozzle clean before calibration to avoid any interference during the process.

4. Z Height Diff Calibration

Click "Z Height Diff"

Click "Start" to start Z offset automatically. If the printer hasn't homed before, it will home itself first. After that, click "Start" again to begin calibration.

While calibrating the Z-axis offset, the extruder will move towards the sensor automatically. Please observe if the nozzle is positioned above the probe sensor. If not, use the Adjust Zprobe Pos function to adjust the nozzle.

(Put the PEI sheet back to the heated bed.)

After finishing, click "Save" and restart the machine.

Adjust Zprobe Pos

Click "Start" and move the XYZ axis to position the nozzle directly above the center of the metal sensor. Then "Save" the value. After that, perform the "Z Height Diff" procedure again.

Note:

1.  **Z-calibrate, Auto-leveling, XY offset and Z height diff** must be performed after replacing the nozzle, hotend, or removing/reinstalling the extruder.

2.  **Leveling:** Before starting the leveling process, heat the bed to 60°C and wait for 20 minutes. This allows for thermal expansion of the glass to stabilize, ensuring accurate leveling.

3. Bed Leveling Frequency:

It is recommended to perform bed leveling every 20–25 print jobs. The Frequent removal and repositioning of the glass bed can gradually lead to positional deviation. Timely leveling ensures consistent print quality.

4. How to Determine if Leveling is Needed during printing:

Carefully observe the first layer when starting a new print. If there is a large gap between the filament and the heated bed, poor adhesion, warping, curling, or uneven extrusion (e.g., some areas too thick, others too thin, or broken lines), it indicates that bed leveling is required.

5. **Calibrate PID**

Before using the machine for the first time, it is essential to perform temperature calibration.

The nozzle's compensation values must be adjusted according to different ambient temperatures. Proper calibration ensures accurate and stable temperature control during printing, thereby improving print quality.

5. Input Shaper

Click "Input Shaper" 

Click "Auto-calibrate", After calibration is complete, click the save button.

6. Calibrate PID

Click "Preheat"

Click the temperature value

Set at "220°C"

Click "Accept"

Click "Save"

4. Operating interface introduction

Main interface

	Primary interface	Explain
01	Temperature	Temperature display area.
02	IP	Network IP address.
03	Move	Adjust the value of the XYZ axis.
04	Preheat	Pre-set nozzle & hotbed's temperature.
05	Extrude	To unload or load filament.
06	Calibrate	Printer Calibration
07	Settings	Printer's printing value adjustment.
08	Print	Start printing.
09	Shutdown	Shutdown interface.
10	Homepage	Return to the main page.
11	Return	Return to the previous page.

Calibrate:

	Secondary interface	Explain
01	Z Calibrate	Calibrate Z offset
02	Leveling	Auto-leveling
03	XY Offset	Calibrate XY axis
04	Z Height Diff	Calibrate Z axis
05	Input Shaper	Test the resonance compensation value.
06	Adjust Zprobe Pos	Adjust Zprobe Pos

Settings:

	Secondary interface	Explain
01	Network	To connect Wi-Fi
02	Fan	Cooling fan adjustment
03	Leds	Turn on/off Light
04	System	Machine shutdown, restart, reset function
05	Update	Update Klipper and Klipperscreen
06	Manual	Manual
07	Troubleshooting	Troubleshooting
08	Power Loss Recovery	Resume the print after a power failure or system error
09	Force move	Move the toolhead if necessary before resuming the print
10	More	Includes some basic settings such as time, language, screen timeout, notification sound toggle, and automatic shutdown after printing completion.

Printing Interface:

Figure 1

Figure 2

	Secondary interface	Explain
01	Cancel	Stop printing
02	Pause	Pause printing
03	Fine Tuning	Adjust Z-offset, Printing Speed, Printing Flow [Please refer to Figure 1.]
04	Settings	Basic setting, browse camera, adjust cooling fan, light and Exclude object. [Please refer to Figure 2.]
05	Stop	Emergency stop .

5. Load filament

1. Place the filament on the holder and insert it into the PTFE tube. Continue pushing until it cannot go any further. (Make sure the filament is inserted in the correct direction.)

The filament in the right cabinet is routed to the left extruder, and the filament in the left cabinet is routed to the right extruder.

2. Remove the PTFE tube from the toolhead and manually feed the filament into the toolhead until it stops.

3. Feed out the filament

Click the temperature setting

Enter the filament recommend temperature value, click then click

Click the "Extrude"

Click Extruder "T0" , select Distance "100mm" and Speed "5", click Load 2-3 times till the filament goes out of the nozzle.

Follow the same steps, you can install the filament into the right extruder.

4. When the filament feeding is finished, insert the tube into the toolhead

6. Printing

Test Printing

Before printing your won model, please test the gcode which shipped from the printer first

Click "Print"

Click Print icon

Observe the first layer during printing

Click Fine-tuning

Select the distance at 0.02 and increase the Z-offset until the line is smooth

The final result after adjusting

Explain:

The first layer very important

1. There are gaps between each lines, that means the Z-offset need to be lower.
2. There are waves on the printing surface, that means the Z-offset need to be higher

Printing Tips:

During printing, if the model is too close to or too far from the build plate, you can use the fine-tuning function to adjust the nozzle height:

1. Tap "Fine Tune".
2. Select a tuning step of 0.02, then use Z+ (raise the nozzle) or Z- (lower the nozzle) to adjust the height until the extrusion lines are evenly laid and properly aligned.

Proper fine-tuning helps achieve optimal first-layer adhesion and print quality.

7. Resume Printing

1. Resume printing after power off

After power is restored, turn on the printer. It will perform a selfcheck. Then go to Settings > Power Loss Recovery to resume printing.

Note:

1. If the printed height is less than 1 mm, resume printing is not supported.
2. Prior to resuming the print, verify whether the nozzle has dropped. If so, use the "Force Move" function to position it approximately 0.1 mm above the model surface.
3. After resuming the print, closely monitor the printing process and adjust the Z-offset via fine-tuning if necessary.

2. Resume printing after filament used off

The printer will pause, and the yellow indicator light will turn on

Insert the new filament into the extruder, then click "Load" until the filament is extruded from the nozzle.

Click "Resume" , continue to print from the point of interruption.

8. Slicing Software Installation and Usage

Installation:

Search "www.3dmingda.com/download" in any browser.

Download "MINGDA OrcaSlicer"

Configuration:

If you are the first time to use MingDa OrcaSlicer, you will enter the configuration wizard.

Select MingDa MD-400D, Click "Confirm".

Select the desired filament type.

Usage

Click "Prepare".

Prepare

Select the printer model, filament type and printing parameter.

Click , upload your STL in your slicer, adjust your model parameter, after finishing, click "Slice plate" to create the Gcode file.

Printing

Copy gcode from USB to printer

Click "Copy"

Remove the text before the .gcode name and including the "/" symbol.

Then click "Save"

LAN Printing (Recommend)

Ensure that the printer and the computer host are on the same local network.

Click "Settings" to enter the settings page.

Click "Network" to enter the network page.

Check the printer's IP address.

Click WIFI , select Host type as Octo/Klipper, enter the printer's IP address, and click "Test" and "OK"

File Transfer:

Click the dropdown icon  in the top right corner , select "Print."

Click "Print" and choose "Upload and Print."

Device Connection

After successful connection, click on "Device"

Device

Enter the control interface below the diagram

1. **Task List:** Drag G-code files to this task list for printing.
2. **Temperature Control:** Displays machine temperature changes and allows pre-setting nozzle and bed temperatures.
3. **Camera:** Monitors the printing status.
4. **Movement Control:** Controls the movement of each axis and allows compensation settings after leveling.
5. **Printer Limits:** Controls the maximum acceleration of the printer, usually doesn't need to be changed.
6. **Console:** Sends G-code commands to run the machine and displays error output.

Print Mode

Copy Mode

Print Size: X * Y * Z: (2*200) * 400 * 400mm

In duplication mode, select the [MingDa 400D 0.4mm nozzle](#) for slicing. Place the models on the left side of the build platform, ensuring they do not cross the blue line, as shown in the image. Then make a slicing directly and save the gcode inside Udisk.

Note: The model must be placed on the left side and sliced by T0 extruder.

In the printer interface: Insert the U-disk on the printer, and follow the bellow operation to make a copy printing.

Select "Print."

Insert the U-disk.

Choose the print file for printing.

Choose "Copy Print".

Mirror Mode

Print Size: X * Y * Z: (2*160) * 400 * 400mm

In mirror mode, select the [MingDa 400D 0.4mm nozzle](#) for slicing. Place the models on the left side, ensuring they do not exceed the red area on the platform in the image to prevent nozzle collisions.

Note: The model must be placed on the left side and sliced by T0 extruder.

In the printer interface: Insert the U-disk on the printer, and follow the bellow operation to make a mirror printing.

Select "Print."

Insert the U-disk.

Choose the print file for printing.

Choose "Mirror Print".

Print Two Colors

Printing size: 400 * 400 * 400mm

Selecting the [MingDa 400D 0.4 nozzle](#)

1. In the Process section, click to switch to the "Objects" option.
2. Click on the color box next to the STL file to select the desired filament.

In the printer interface:

Select "Print", Insert the U-disk.

Choose the print file for printing.

Choose "Print".

Double extrusion: Start the Prime tower

Because there is always one printer in standby mode during the printing process, it is easy to cause defects such as wire drawing and material leakage. Prime tower can solve this problem, the extruder will print a prime tower before each layer printing. Any material leakage will be printed on the tower, effectively avoiding the phenomenon of material leakage when replacing the extruder.

If you want to print the following two modes, we recommend adding this option to your Gcode.

1. Select the "Global" section.
2. Select the "Multimaterial" section.
3. Check the "Enable" option in the "Prime tower" settings.

Note:

1. Avoid setting the wipe tower size too small, as insufficient purging may lead to filament mixing.
2. Ensure the prime tower is positioned away from the model to prevent overlap.

Printing Support

Printing size: 400 * 400 * 400mm

Selecting the [MingDa 400D 0.4 nozzle \(Dual\)](#)

1. Choose and modify the filament information.
2. Then, select the "Support" section.
3. Check the "Enable support" option.
4. In the "Filament for Supports" option, choose the filament needed for supports.
5. Click "Slice plate" to preview.

In the printer interface:

Select "Print", Insert the U-disk.

Choose the print file for printing.

Choose "Print".

9. Maintenance and Care

Hotend:

If you print high-temperature materials or engineering materials for a long time, the inner wall of the hot end will gradually carbonize, which will ultimately affect the extruder out of the material is not smooth, if you find that the model has a fault or spitting material is not uniform, it may be this reason.

Replacing Filaments:

Timely replace filaments based on the type and actual usage. It is recommended to use filaments recommended by the manufacturer. Seal filament not in use for an extended period, as excessive exposure to moisture in the air can make the filament brittle.

PEI plate:

Please avoid touch the PEI bed by hand. It can be cleaned by dish soap with warm water and dry it by a clean cloth.

Regular Lubrication:

Once every 3 months. Home the printer first and grease it and move the Z+ to the top, then home the printer and grease again until the screw rods full with the grease, after that clean the excess grease. If there are noise during moving. You can grease the oil on the idler wheels when there are noise.

Software Updates:

Regularly update the printing software to improve print quality and efficiency.

10. Printing Tips for different filaments

1. Do not allow PET-GF, PET-CF, PA12-CF, HTPA-GF, HTPA-CF or S-Multi to absorb moisture.

1. Dry the filament before printing as long as you are not sure if the filament is damp.
2. After drying the filament, please store it in filament cabinet with driers
3. If the printer will not be used for an extended period, please store the filament in a sealed container, preferably in a dry cabinet.

2. Avoid PLA-HF/PETG-HF clogged during printing

1. When printing PLA with a bed temperature above 45 °C, open the front door to prevent heat buildup and extrusion issues.
2. When printing PETG with a bed temperature around 70 °C, open the front door to prevent overheating that may cause extrusion issues or nozzle clogging.

3. To prevent warping, take caution when printing with ABS-HF, PA12-CF, HTPA-GF, HTPA-CF, ABS-GF25, ABS-CF20, HtPA-GF25, and HtPA-CF25.

If the model size is large and the fill rate is set high, such as 60% (the default value is 15%), warping occurs and it can be adjusted down appropriately. In addition, change the fill pattern to a spiral to reduce the risk of shrinkage. For some structural parts with high strength requirements, you can set 5 layers of walls and a fill rate of about 25%, and try to avoid using a fill rate of more than 50% to reduce the shrinkage tendency; for most non-structural parts with low strength requirements, you can directly select the default 2 layers of walls and a fill rate of 15%.

4. After printing with high-temperature materials such as PA-CF, PET-CF, or PET-GF, and before switching to low-temperature, lower-hardness materials like PLA or PETG, it is recommended to follow these steps:

1. Set the nozzle temperature to 250–300 °C.
 2. Manually unload the remaining high-temperature filament.
 3. Load the new low-temperature filament and manually extrude it.
 4. Continue extrusion until all residual high-temp material is flushed out and the new filament flows smoothly.
 5. Lower the nozzle temperature to 220–240 °C, and continue extruding while the nozzle cools down to ensure smooth flow of the new filament.
- If extrusion fails during the flushing process, increase the nozzle temperature and consider using a cleaning needle to clear the nozzle
