

WARNING!

Do not restore power to the water heater before filling the tank with water!

Failure to completely fill the water tank after replacing the heating elements can result in the damage or failure of the elements.

To properly fill the tank, open a hot water faucet in your home and then turn on the cold water supply to the water heater to fill the tank.

Shut off the hot water faucet only after getting a constant flow of water without any air bleeding out of the line.

Once the tank is properly filled, restore power to the water heater.
